\*The Use of [High-Frequency] Dielectric Drying in Precision Casting. P. I. Evitseev (*Litaince Proizvodstvo*, 1953, (5), 19-20).—[In Russian]. Drying of moulds by H.F. currents is described. The method presents special advantages in drying moulds  $>500 \times 500 \times 500$  mm. The time required to reduce the moisture content from 12 to 0.3% was cut from 5 hr. to 20-60 min. by using frequencies of 5-10 Mc/s. Drying temp. was  $130^{\circ}\text{C}$ . After drying it was possible to start firing of the moulds at  $600^{\circ}\text{--}700^{\circ}\text{C}$ . and to decrease the firing time from 18 to 4 hr. The moulds produced by this method were of high quality and so were the castings made in them.—S. K. L.

TITLE: Butt Welding by a High Voltage Capacitor Discharge on the Parts to be Welded (Stykovaya svarka razryadom vysokovol'tnykh kondensatorov na svari-vayemye detali)

PERIODICAL: Svarochnoye proizvodstvo, 1959, Nr 1, pp 28-31 (USSR)

ABSTRACT: Information is given on butt welding of copper with copper, aluminum with aluminum and aluminum with copper wires of 1.6-5 mm in diameter by a capacitor discharge, ensuring a mechanical strength of the weld joints, equal to the base metal strength. The weld joints have no pores, cavities, cracks or impurities, and a minimum heat affected zone. Optimum parameters of the process are given. To obtain high quality joints, flat face working, ensuring parallel surfaces, is imperative. The described method can be used for joining dissimilar

TITLE: The Use of Capacitors in Impulse Electric Welding  
Machines (Primeneniye kondensatorov v impul'snykh  
elektrosvarochnykh mashinakh)

PERIODICAL: Vestnik elektromyshlennosti, 1959, Nr 5, pp 49-52 (USSR)

ABSTRACT: Capacitor impulse welders are produced in the USSR for spot, butt and seam welding of thin parts. The power capacitors are an important factor in the cost and size of such welders. The characteristics of impulse welders types MTK-2 and TKM-4, and also of a new type MTK-2 machine with 1000 V capacitors instead of 500 V, are given in table 1. The changes in cost of various parts of the machine when the capacitor voltage is raised from 500 V to 1000 V are seen in table 2, showing that the change in output of 63 W-sec to 250 W-sec involves a price increase from 2476 to 4228 roubles. The cost data in table 2 relate to available types of capacitor which are not well suited to electric welding machine requirements. If special capacitors were designed they could be made much smaller and more cheaply. The advantages of using 1000 V

Card 1/3

SOV/110-59-5-14/25

The Use of Capacitors in Impulse Electric Welding Machines

capacitors in these machines are then considered; for many types of work such machines are far better than ordinary a.c. machines. The weight and cost related to 1 W-sec for different types of capacitors used in impulse welding machines are given in table 3. Available electrolytic capacitors are relatively cheap but being polar they are not well suited to the oscillatory conditions that arise in impulse welding machines. Available types of oil-impregnated paper-insulated impulse capacitors are expensive, though their size could be reduced by using chlorinated hydrocarbons or castor oil as impregnant. A disadvantage of oil/paper capacitors is that they hold a remanent charge and may thus become dangerous to operators. Metallised-paper capacitors would be well suited to the work but are not available in adequate current ratings. It is concluded that as no capacitors really suited to impulse welding duty are available they should be developed forthwith. Non-polar electrolytic, metallised-paper and paper/oil types are all required; the latter should be impregnated with castor oil or chlorinated hydrocarbons. Capacitors

Card 2/3

The Use of Capacitors in Impulse Electric Welding Machines

for use with welding machines should be able to operate continuously with an ambient temperature of  $-35$  to  $+50^{\circ}\text{C}$ ; electrolytic types should be suitable for charging voltages of 80 and 500 V; for paper and metallised-paper types the figure should be 1000 V. The capacitances required at different voltages are enumerated. There are 3 tables and 3 Soviet references.

TITLE:

New methods of welding by "fusion into globule" by means of capacitor discharge

PERIODICAL:

Priborostroyeniye, no. 10, 1961, 14 - 17

TEXT:

The author describes the construction and operation of fusion welding tools and the design of the electrical power supply circuit. If one of the leads of a series of charged capacitors connected in parallel is connected to a carbon electrode and the other lead to two metal pieces to be welded, and both ends are brought near each other, an arc discharge will take place fusing the ends of the two parts into a globule shaped junction. An indirect method involves two carbon electrodes and metal pieces to be welded placed in the path of the arc. The welding arrangement is depicted in Fig. 2. where bloc I represents the electrical circuit and bloc II the welding instrument. *f* is a change-over switch (from charge to discharge). The direct action welding instrument consists of a pair of pliers having an

Card 1/3

New methods of welding by ...

asbesto-cement tube mounted on its axis. A spring-loaded graphite-ended electrode is located in the tube coaxially with the ends of the metals to be welded. The electrode, which is movable is insulated from the pliers. The welding operation requires one hand only. The indirect arc action welding instrument consists of a cylindrical rod made of two conducting plates insulated from each other and forming two electrodes. One end of the assembly has a spherical cavity where the ends of the metals to be welded are inserted. This instrument is very useful for welding metals in inaccessible places. The arc discharge takes place in the spherical cavity of the instrument without being seen by the operator. The ends of the instrument are usually made of graphite, tungsten or molybdenum which prevents adhesion to the welded metals. In order to prevent deformation of the junction by the electrode during the time when the ends of the welded metals are molten, an electrode travel limiter is used in the direct arc action instrument. This enables an increase of speed of electrode movement from 0.01 m/sec (without the limiter) to 4 m/sec. The capacitor charging voltage normally used ranges from 80 to 1000 volts. Long-life electrolytic capacitors are used. In order to obtain the desired quality of discharge an addition

TITLE: Butt welding of 1Kh18N9T steel wire with a diameter of 0.3 to 0.6 mm

SOURCE: Svarochnoye proizvodstvo, no. 4, 1964, 20-21

TOPIC TAGS: 1Kh18N9T steel, steel wire, butt welding, flash welding, resistance welding, austenitic steel

ABSTRACT: As a part of the author's investigation, he was required to produce joints with a minimum loss and maintain high durability. Comparisons and examination of flash and resistance welding were made; the results are given in graphs. It was found that flash welding produces the better results in joint strength, stability, and external appearance of the butt. In flash welding, requirements for preparing and sintering the wire ends may be lowered; this greatly affects production. Orig. art. has: 3 figures and 2 tables.

TITLE: Measuring units of the "Tsentrrotekhnika" system

CITED SOURCE: Tr. Mosk. energ. in-ta, vyp. 52, 1963, 133-146

TOPIC TAGS: supervisory control system / Tsentrrotekhnika system

TRANSLATION: Measuring units are described of the "Tsentrrotekhnika" supervisory control system. The system is designed for operation with several types of thermocouple sensors, resistance thermometers, and differential-transformer sensors. For each type, special measuring units have been developed which connect the sensor output with the nonelectric measurands and convert them into a binary digital code. Each measuring unit is constructed as a separate adapter which includes all measuring elements. by means of a special plug-and-socket

Card 1/2

L 00008-66

ACCESSION NR: AR5008446

device, the adapters are connected to the system circuit. All measuring units convert the deviation of the measurand from its normal value into a digital code. The measured difference between the present and the normal values is converted into the code by means of a developing discrete transformation. Special individual settings are used to obtain signals corresponding to normal values. Figs. 8. Bibl. 4.

TITLE: Influence of high-temperature heating of cold-worked metal on its structure and properties  
SOURCE: Akademiya nauk Latvyskoy SSR. Institut avtomatiki i mekhaniki. Prevrashcheniya v splavakh i vzaimodeystviye faz. Riga, 1961, 151 - 161

TEXT: This investigation was sponsored by the Riga Railroad-Car Works. In constructing the electric train-car ЭР-5 (ER-5) the necessity arises for cold plastic deformation of sheet metal (of the 20 KII (20KP) brand) with subsequent welding. Hardened zones may be affected by heat which may in turn lead to substantial changes in structure and properties. The mechanical tests were performed on a 'Шопер' ('Shoper') machine with a deformation velocity of 10 mm/min. The specimens were deformed manually on moulds of varying radii (3, 5, 40, 100 mm and ∞). The specimens were then flattened out and tested for tensile strength to establish the properties before heating. Other specimens were heated after deformation to temperature.

Card 1/2

Influence of high-temperature ...

peratures of 600, 700, 800, 900, 1000, 1100, 1200 and 1300°C for times of 2, 5, 10 minutes in a salt bath, cooled in air and tested for tensile strength. The measured tensile strengths and elongation are plotted vs. the normalization temperature for every deformation radius. At all deformations a sharp maximum of the tensile strengths appeared at a normalization temperature of 900°C. Maximum plasticity was observed in specimens which have been normalized at 1000 - 1100°C. Impact tests were performed on specimens of non-standardized dimensions, and a slight decrease of the impact-resistance (of about 11 %) was noted in the heated specimens compared to that of the unheated deformed samples. Comparing the data of the non-deformed samples with the deformed ones, it is seen that cold-working of 20KP steel increased the tensile strength by 10 - 12 % and decreased the plasticity by 15 - 18 %. Heating of the deformed and non-deformed samples did not affect their relative tensile strengths and plasticity. In welded specimens the plasticity decreased in both deformed and non-deformed states by ca. 50 % compared with the elongation of non-welded specimens, while the tensile strength remained unchanged. There are 5 figures, 4 tables and 10 Soviet-bloc references.

TITLE: Rapid high-temperature cyaniding by the application of case-hardening pastes and induction heating

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 3, 1964, 23-33, and insert facing p. 40

TOPIC TAGS: case hardening paste, potassium ferrocyanide, carbon, barium carbonate, case hardening, cyaniding, induction heating, high-frequency heating, cyanide hardening, surface hardening

ABSTRACT: The authors investigated the effect of case-hardening mixtures, composed of various amounts of potassium ferrocyanide, carbon, a hydrolyzed ethyl-silicate bond and barium carbonate, in small machine parts. The paste was applied to the degreased surface of 25mm long pure iron and steel specimens with a 16 mm diameter. The specimens were dried for 10-20 min at 20 C and for 60 min at 70 C. Air cooling proved secure adhesion to the surface. The optimal thickness of the coating was 1.5 mm. Induction heating at 1200 C resulted in the formation of a

Page 1/2

ACCESSION NR. AP4020245

0.3 mm thick diffusion layer within 30-35 seconds. Despite a high hardness, the case remained ductile and microcracks were not identified. Corrosion resistance was greatly improved. The distribution of carbon and nitrogen in the diffusion layer was found to depend on the composition of the paste. The carbon contents increased in proportion to an increase of cyanide in the mixture. Microhardness reached a maximum H<sub>v</sub> 1100. Grain coarsening was not observed after a short heating up to 1200 C. Orig. art. has: 8 figures and 2 tables.

AUTHORS: Yermakov, A. N.; Marov, I. N.; Yevtikova, G. A.

TITLE: Zirconium- and hafnium-complex formations with triacetonitrile

SOURCE: Zhurnal neorg. khim., v. 9, no. 2, 1964, 499-501

TOPIC TAGS: triacetonitrile, zirconium complexes, hafnium complexes, complexones, Zr-Hf complexes,

ABSTRACT: While inorganic complexes of  $Zr^{4+}$  and  $Hf^{4+}$  and their equilibrium and stability constants are known, nothing is known about their complexes with such wide spread substances as complexones. Therefore the authors undertook a study of  $Zr^{4+}$  and  $Hf^{4+}$  complex formation with triacetonitrile (TAN) in a strongly acidic medium and determined the compositions and the equilibrium constants of complex forming. In the tests, the ion exchange method was applied, and cation exchange resin KU-2 was used. Metal concentration ( $Zr^{95}$ ,  $Nb^{95}$ ,  $HE^{181}$ ) was  $10^{-6}$  mol/l and acidity 1-2 mol/l  $HClO_4$ . TAN concentration varied between  $0.4 \cdot 10^{-4}$  and  $25 \cdot 10^{-4}$  mol/l; and its equilibrium concentration nearly equals the analytical. Tables of

Card 1/2

ACCESSION NR: AP4012454

experimental data were drawn up and corresponding curves plotted. It was found that in 1 and 2 mol solution of  $\text{HClO}_4$ , complexes of 1:1 type are formed. Formation constants of  $\text{HfA}^+$  and  $\text{ZrA}^+$  are determined as  $(0.68 \pm 0.03) \cdot 10^4$  and  $(1.2 \pm 0.1) \cdot 10^4$  / 2 mol  $\text{HClO}_4$ ;  $(11.2 \pm 2.0) \cdot 10^4$  and  $(27.4 \pm 2.6) \cdot 10^4$  / 1 mol  $\text{HClO}_4$ , respectively. It was found that in the TAN interaction with  $\text{Zr}^{4+}$  and  $\text{Hf}^{4+}$  ions, three hydrogen ions are liberated. Orig. art. has: 1 Figure, 10 Formulas, 2 Tables.

 ABSTRACT : A study of 17 varieties and hybrids was started at the Yaroslavl' Agricultural Institute in 1956. When sown on the 29th of May, the male inflorescences appeared on Chishminskaya, No. 1 Gorki Leninskiye, Nanchinovskaya and Voronezhskaya '76 between the 21st and 31st of July, and the female inflorescences - between the 10 and 14th of August. These same varieties gave a higher yield of green roughage with ears. In VIR-42, Moldavanka zhel'taya and Minnesota, the male inflorescences appeared in the period

Title : Fertilization Methods for Fruit Cultures.

Orig Pub: Udobreniye i urozhay, 1957, No 2, 33-41

Abstract: Experiments carried out by the Scientific Research Institute of Horticulture and by experimental stations (Michurinsk, Uman', Kuybyshev, Kryn, Melitopol', Sochi, etc.) indicate that a very efficient fertilization for gardens consists in the application of 30-40 t/ha manure (once in 2 years) or of organic and mineral fertilizers in a combina-

tion of 20 t/ha manure and 40-60 kg/ha NPK. If only mineral fertilization is applied, an efficient dose of NPK is 90-120 kg/ha. A very important point is the application of the fertilizer in deeper layers, i.e. 20-50 cm. Furrows or ditches, 18-20 cm deep for apple trees and 12-14 cm deep for stone fruit trees, may be used for the application of the fertilizer. Siderates are used in autumn tillage to replenish the organic mass. Side-dressing with N is more efficient during the flowering period and after the ovaries drop in June. If the fruiting is very heavy, June side-dressing with N is recommended. Very efficient is liquid dressing with dung water, fecal matter or poultry dung. Top-

AUTHOR: Yevtushenko, A.F.

TITLE: Operating experience with the experimental electrical simulator  
ЭМСЛУ-1 (EMSLU-1)

PERIODICAL: Referativnyy zhurnal, Avtomatika, telemekhanika i vychislitel'naya  
tekhnika, no. 3, 1963, 13 - 14, abstract 3B73 (Tr. Rostovsk. inzh.-  
-stroit. in-ta, 1961, no. 23, 103 - 106)

TEXT: The electrical simulator EMSLU-1 developed at the research laborato-  
ry of PMCH (RIS) is designed for solving systems of algebraic equations with  
an asymmetric matrix satisfying the Gauss-Zeidel convergence conditions, and  
contains an analog grid of fixed impedances. The solution of the system of alge-  
braic equations may be derived into two stages: 1) preparation of the system  
for solution, and 2) setting the problem and the solving. The process of prepa-  
ration consists in reducing the given matrix to a so-called auxiliary matrix.  
An example of solving a system of algebraic equations of the eighth order with a  
grid and without one is given. It is noted that in solving problems with the
